ABSTRACT

FORMULA MILK PREPARATION APPARATUS AND METHOD

Formula milk preparation apparatus 10 comprises a support structure 12, and first and second containers 14 and 16 supported by the support structure 12. The first container 14 is adapted to hold a liquid, and the second container 16 is adapted to hold powdered formula milk. Means (24) for regulating the temperature of the contents of the first container 14 is provided, as is means (26,32) for dispensing an amount of content of the first and second containers 14 and 16. Means (56) for mixing together the contents dispensed from the first and second containers, and means for cooling the contents dispensed from the first and second containers to a temperature suitable for consumption are also provided. A method of using the apparatus is also provided.
